RF UNIT >

Portable data units are widely used in retail stores because they allow you to save time and improve productivity. Our RF portable unit provides a complete access to your database so you can verify or change a price, receive stock, update information, enter orders, and even print labels. The portable units used with the SMS software give you access to any function of the SMS software. Being mobile in your store for executing your daily tasks is our priority.

- Direct item maintenance
- Price maintenance
- Shelf location maintenance
- Label printing ordering
- Purchase order entry
- Receiving verification
- DSD receiving
- Inventory count
- Inventory adjustment
- Transfer of items between stores
- Ability to switch from RF to PC screen without losing the current transaction

ONLINE INVENTORY >

Inventory management is a major concern for companies today and we have addressed this issue based on our experience working with retailers. Taking inventory count is not easy but essential in a control environment. From importing a file from a third party inventory count company or doing your own inventory with a RF unit, SMS gives you all options. Our inventory screen helps you adjust or count inventory with a real picture on the effect of this adjustment on your inventory value at cost and retail. Timing is not a concern anymore, enter your inventory at your convenience and change the date of your inventory, SMS recalculates your inventory up to the minute.

- Inventory count and/or adjustment
- Variance on cost and retail calculation
- Reason code for adjustment
- Transfer of items between stores
- Multiple searching capability
- Suspension and retrieval of inventory count or adjustment

RECEIVING >

After your purchase order is recorded, you can keep track of the quantity and cost of your order. SMS stores the order and waits for the good to come in. At the receiving time, the Purchase order is sent back, so you can accept only the quantity you ordered and minimize the risk of errors. With this process of matching your receiving with your purchase order, you can get an instant result on what is short and make a decision whether you want to follow up your back order or not. Printing labels right from the receiving deck is covered in SMS. Unlimited label formats are available and you can print one label per case or for every item you have received.

BILLING >

Billing is not a headache anymore, you just need to match your supplier invoice with the information entered at the purchasing stage. Don't miss any allowance, rebate or discount, this is where your profit is. Billing back is also recorded so you can print a Debit note directly from SMS and mail it to your supplier.

SPECIFICATIONS >
